

KirbStomp Sprint 3 Reflection

For this sprint, the team agreed upon our final code base, so we had a strong code base to work with. This allowed each person to work independently on their assigned tasks. Our workload was distributed more evenly, depending on the amount of effort it took us to complete the task. Each of us had one specific aspect of the game we focus on. Our git system was also good, we did more incremental pull requests. The team also communicated with each other better. Our meetings were more effective, and we regularly update our progress, so everyone was on the same page.

However, there are some things we could improve on. We did not do so well on following deadline for each task. Our keyboard controls were also not documented which made it a little confusing since we were using many different controls. We also have some divergent animations. Our code quality was not so good since we had a lot of long functions and methods. Since some of our team use MAC while others use Window system, we sometimes had issue with code running on one system while breaking on another.

With our upcoming Sprint 4, we need to set stricter deadline and ensures everyone follow them. We also need to get our classes structure in early even if they are not implemented, so other team members who need to utilize the class understand what they need to follow. We need to make sure to keep things standardize between MAC and Window system. Additionally, we should get our code reviews done earlier since we did them towards the last week of the sprint which did not allow enough time to fix everything. However, our code review depends on our pull requests. Therefore, we should be doing more pull requests and earlier, even if they are for minor tasks. Overall, the team worked very well together for this sprint, but we need to be more on top of our tasks.
