

KirbStomp Sprint 4 Reflection

For this sprint, the team did well with splitting tasks and working independently on our part. We communicated with each other often, so we always know what everyone was doing and their progress. We also have a good bug reporting system. When we merged our code together and it broke the system, we helped each other figure out the issues and resolve them. We had a decent amount of pull requests and minor margining issues. Furthermore, we refactor our scene loader which help clean up our code and make it easier to add new scene.

However, there are a lot of things that did not go well. A lot of us were behind on our tasks, so a lot of features were added on the last week. This is also because our task is bigger now and we did not make smaller pull requests which is something we should have done. On some part of our task like the UI, we should focus more on adding onto the existing code rather than changing it completely. We also did not do enough play testing. We did not have a clear test plan, which made it hard to verify if the functionality we had was altered with the new changes we pushed in. We also did not spend a lot of time refactoring the code, so our code contains a lot of magic number and strings.

Going forward with our next sprint, we will need to do more pull requests with smaller commits. This will make it easier to detect if something breaks if merged into our current system. We also need to do better with following the deadline we set for our tasks. In addition, we need to prioritize functionality of the code over cleaning up our code and when we have time at the end of the sprint, we can do the refactoring. Overall, the team worked well together with updating each other on our tasks and helping debug issues.
