

KirbStomp Sprint 2 Reflection

Our sprint 2 did not go as well as we expected it to. There are a lot of things we could improve on for our next sprint. First, we completed all the required sprint functionality. All of us completed our assigned tasks. We think we did well with taking care of the data problem, getting all the necessary sprite data we need for our game. In addition, we have a lot of documentation on our project. We have all our meeting notes and important information related to our project such as how our sprite sheet data works and relevant GitHub commands. We also have a great GitHub setup with a base repository for merging everyone's code together.

However, our initial planning for Sprint 2 was not good enough which caused us to spend more time on the last week getting all the functionality to work. We did not plan our base structure for our code well, so there were too many side projects going on. The lack of communication and set tasks led to each of us doing our own thing rather than collaborating. This caused issues with integrating one member's code into another member's code structure. Our work distribution was also uneven. We did not properly split the work since we did not have a strong code base to work on and we could not agree on our system until late into the sprint. We still have conflicting opinions regarding which system we should use for our project. On the GitHub side, most of us were still learning the GitHub system, so sometimes we messed up the branches and have trouble with merge conflicts.

Going forward for our next sprint, we will need to plan our sprint tasks better. We have to discuss and decide which code base structure we will use for our game (ECS or Object-Oriented). We need to have a solid code base in order to be able to split work evenly. We need to break down the tasks into smaller tasks, so each person has something to do and can contribute. We will communicate with each other better and work more collaboratively. We will set hard deadline on each task and focus on the sprint functionality, so we can complete all the sprint requirements on time. For GitHub, everyone on the team need to follow the proper workflow which is making their own branch of the Sprint branch and make pull request to merge. We also have to use squash and merge or squash and commit to clean up commits. Overall, better planning and communication will help our team work together better and deliver higher quality code.
